Dalitz plot analyses from FOCUS collaboration

Paolo Dini
for FOCUS Collaboration

INFN Milano

Charm meson decay-dynamics has been extensively studied in the last decade. Dalitz plot analysis has revealed as a powerful tool for investigating effects of resonant substructures, interference patterns and final-state-interactions in the charm sector. Recent results from FOCUS on D_+ and D_s decays will be presented with particular emphasis on the decay amplitude formalism; isobar model and K-matrix model results will be compared and discussed.
